Subject: update

As required, WV Department of Highways was given 48-hour notice by the facility that they were planning to begin excavation operations adjacent to Barlow Road. Therefore, ditch clearing will begin on Friday, February 14. The RP's contractors are aiming to identify one of the off-Site water sources and divert the water away from the facility.

The facility's plan is to complete removal of all of the products from Site, then begin cleaning and dismantling the tanks on Site. A portion of the tanks on Site will have to remain intact, as some of them are being used for temporary water storage and some may be used for treatment, as they have aeration capability.

CSB is working with the AGO and is awaiting plaintiffs' comments prior to beginning their physical investigation on Site, which will involve mapping the MCHM tanks and removing a section of tank 396. This portion of their investigation will last for approximately one week.

The flow rate of the off-Site water into the containment area is estimated to be 5 gallons per hour. The RP's contractor continues to oversee water pumping operations where required.
